

1. ViewAllReminders.java allows the user to scroll through all the reminders to view, edit, or delete them. The user can navigate to any class and can also delete all the reminders. When the date and time of the reminder is reached a notification alarm, pop up, and vibration occurs. If the user wants to they can delete the reminder by clicking on the notification from the drop down menu, if they want to keep it they can swipe to the side.

2. EditReminder.java allows the user to click on any reminder and edit any aspect of it and/or delete it. This way the user can just keep the same reminder and continue to edit it without ever making a new one.

3. AddReminder.java allows the user to create a new reminder and add it to internal storage. After entering in all the desired information for the reminder the user is taken to ViewReminders so they can see the reminder they just put in.
